ALPINA GEMS - FREERIDE TUWEL

8:30 am. The first cable car departs for Gemsstock. The crowd is great and so is the tension. "No friends on powder days", as they say here. Who will get the first tracks? There will be running, skating, then skiing. Sweat and adrenaline flowing. It is precisely for situations like these that we designed the freeride helmet ALPINA GEMS. Lightweight with optimal ventilation, secure in every situation. For a smile on your face.

ALPINA ALTO - DIG DEEPER

A cold sunny morning, freshly groomed pistes, rippled snow. If you like this picture, you'll love the ALTO. It sits comfortably on the head, warms the ears, keeps headwinds at bay – and sharpens the snow's contrast. Skiing has never been more comfortable. No visor helmet has ever had this much style.

ALPINA DOUBLE TACK - DOUBLE FUN

Breckenridge, Colorado. Almost anything is possible here in the Rocky Mountains. Skiing 4,000 metres above sea level, champagne powder, bluebird days, whiteouts. The ALPINA DOUBLE JACK, named for a run at the ski resort there, has all the answers. Active ventilation, a large spherical glass and a magnetic additional lens.

100

ALPINA GEMS - FREERIOE TUWEL

The name Gems refers to a precious stone or jewel. The ALPINA GEMS is our freerider jewel: uniquely glossy, lightweight and equipped with climbing abilities, a gem for the head. A particularly striking feature of the GEMS is the scattered hole pattern structure that allows for ventilation across the entire surface. This feature will come in handy for every freerider during a sweaty climb or in sunny mountain weather. Naturally the active venting can also be operated with gloves on. For extra protection in the backcountry, the helmet has a low cover around the back of the head and a hybrid shell structure, which also distributes the forces exerted by objects striking the helmet, such as ice or rocks in a couloir.

ALPINA GEMS™

If you're looking for untouched slopes, you'll need to look off the beaten path. Look no further for the right helmet: the ALPINA GEMS is here!

Comfort and safety are crucial out in the open country. The ALPINA GEMS is a lightweight, ventilated across the entire surface and provides extra protection with its construction.

ALPINA MAROI

The first cable car to the peak, the first line into the valley. The MAROI is a Freeride helmet for off-piste skiers and powder freaks.

The low weight combined with great ventilation and the typical freerider look make the Maroi an established off-piste helmet.

ALPINA PARSENA

A helmet for every terrain. The ALPINA PARSENA works just as well on both the slopes and in deep snow - and is just as timeless as it is modern.

Thanks to the lightweight inmold construction, you can barely feel the allmountain helmet on your head. The neck warmer provides warmth on cold days or on the lift ride up to the peak.

ALPINA ACTO - DIG DEEPER

Style, aesthetic, innovation. The ALPINA ALTO is a visor helmet for skiers who like to look good and be able to see everything. The newly designed and perfectly interlocking Dig visor system sets new standards in terms of comfort. Thanks to TRM (translation rotation mechanism), the visor seals extra tightly to the face, thus helping the helmet to sit compactly and comfortably on the head. The ALPINA high-tech lenses ensure optimal visibility and sharp contrast. The ALPINA ALTO's active air venting structure guarantees active ventilation. Meanwhile the structure's clean surface lines create an iconic look.

TRM

The "translatory-rotatory-mechanism" (TRM) seals the visor extra tightly to the face, thus helping the helmet to sit compactly and comfortably on the head.

ALPINA ALTO QV■

Anyone who likes snow rippled by a piste basher will love the ALPINA ALTO. Because the visor helmet allows everyone to show off their best skiing.

The Carve is on! With the multi-directional visor joint mechanism for a compact fit, active ventilation, the comfortable Lavalan inlay and an iconic design.

TECHNOLOGIES

CHANGE YOUR PERSPECTIVE

Discover a new world in the snow: with QV (QuattroVarioflex), Q (Quattroflex) and Qlite (Quattroflex Lite). Our top technologies make contrasts in the snow much more visible and allow you to identify hazards more quickly. Change your perspective – and see your next line before you've ridden it.

The combination of Q (Quattroflex) and V (Varioflex) technology. Quattroflex is our highly contrast-enhancing lens technology with polarising filter. Varioflex makes the glass tint automatically. The photochromatic (self-tinting) lens automatically reacts to visible light and darkens in a matter of seconds or brightens if it's getting darker.

one letter with a lot of impact. The highly contrast-enhacing Quattroflex lens technology with polarising filter makes contours in the snow visible and improves perception of surroundings – even in poor weather conditions such as snowfall, fog or diffuse light. The polarising filter minimises confusing reflections and mirroring. This makes it easier to recognise frozen surfaces and other dangerous situations faster.

Seeing contrast with clarity is the most basic feature of ski goggles for ALPINA. That's why all of our models are equipped with the contrast-enhancing Q-lite technology as a minimum.

ALPINA DOUBLE TACK

Fun shared means twice the fun. This adage is a perfect fit for the top version of the ALPINA DOUBLE JACK. The ski goggles have a magnetic additional lens that can easily be removed during poor visibility conditions, and just as easily be reattached to the frame when the sun is shining. One pair of ski goggles, twice the fun on the piste. The DOUBLE JACK with a spherical lens works for almost any use, from the piste to the powder run and even the ski trip.

ALPINA DOUBLE JACK

From the piste to the powder run to the full ski trip, the DOUBLE JACK with spherical lens is suitable for every purpose.

The top version of the DOUBLE JACK has an extra magnetic lens and active ventilation flaps, making it the perfect allrounder goggles.

Elastic trapezoidal girder for optimal drag distribution

Sheep's wool that protects. Not just from cold, bad smells and plastic in the sea. PROLAN provides protection against back injuries. The protector made of pressed sheep's wool fulfils TÜV Norm 1621-2 Level 1. PROLAN is an innovation the likes of which haven't been seen in the sports industry for a long time.

PROLAN'S ADVANTAGES AT A GLANCE:

PROTECTION

PROLAN meets the highest standards for safety. The damping properties of the PROLAN work in all temperatures, and therefore provide reliable protection without compromise in all conditions.

COMFORT

The PROLAN protector adjusts naturally to the back, making it extremely comfortable to wear and ensuring optimal freedom of movement.

BODY CLIMATE

PROLAN provides even warmth and protection against overheating. The breathability of the wool ensures a climate that is always comfortable regardless of activity level and weather conditions.

ODOURLESS

The wool's moisture management and the self-cleaning function of its fibres prevent unpleasant odours from forming due to sweat.

SUSTAINABILITY

Wool is a naturally renewable resource. The wool is obtained exclusively from European sheep, avoiding the need for long transport routes. European wool is mulesing-free.

In places where everything is white in winter, where the hillsides are steep and we pursue our favourite leisure activities, making sparks fly in the snow, sheep graze in the summer. Big sheep, little sheep, white and black. They all have one thing in common: wool. A sustainable resource that has not only protected people from the cold for generations, but was a valuable commodity and still is among mountain folk.

Over the last several years, wool has been ousted by synthetic fabrics as the material for sports gear. Now the warming, protective, natural and sustainable good is seeing a revival. The developers of ALPINA have worked with lavalan®, a Bavarian wool producer near Dinkelsbühl to create something unique: PROLAN™. Wool that protects. Not just from cold, bad smells and plastic in the sea.

PROSHIELD

An ordinary day of skiing in the afternoon: the slope that was still grooved and grippable in the morning smooths into a mogul slope, beneath which lurk ice plates, the sun low in the sky. Falls are unfortunately common in these conditions. That's why it's important to protect what needs protecting. While a helmet has become obligatory by now, very few skiers wear protectors. It replaces a layer of clothing, is breathable and comfortable to wear and . protects the spine from severe injuries.

With PROSHIELD, ALPINA takes entry-level protectors to a new level. This will help protectors become the standard for skiing.

- Comfortable back protector with flexible back plate and breathable mesh vest
- Enhanced protection thanks to additional coverage over hip bones and side impact protection
- Perfect adjustability and optimal fit thanks to trapezoidal waist strap

JUNIOR VEST

Anyone who has, was or still is a child knows that a day skiing is sometimes for than just fun for a child. Heavy shoes they can barely walk in, heavy skis they can't carry properly with ski gloves – and unwieldy sticks underneath their arms. Good thing there are ALPINA helmets (with or without a visor) and goggles that fit comfortably on their heads, are well ventilated and have lenses that don't fog up.

And an even better thing that ALPINA also has back protectors that are comfortable to wear. With this equipment, life as a junior freerider won't be so difficult anymore. Instead, it'll make skiing fun.

Every day.

PROSHIELD Junior is our protector vest with additional side impact protection and perfect adjustment options for kids. Fits good, protects good, is good.

TECHNOLOGIES

Safety, ergonomics and comfort - we are constantly researching, developing and testing to set new benchmarks. For decades, ALPINA has been analysing the diverse requirements resulting from the different anthropometric characteristics of a head. On the basis of this data we optimise our helmets so that they fit each customer perfectly and offer the highest possible safety. In addition to

a good fit of the helmet shell, fitting systems, straps and buckles are part of the ergonomics. The safety of our helmets is guaranteed by using HI-EPS in combination with a polycarbonate or hard ABS shell. Our visor technologies can also be found in the safety section. The comfort category includes interior technologies and various ventilation systems.

ERGONOMICS

ERGO³

ERGO³ allows the helmet to be adjusted so that it fits the head accurately. This involves altering the volume of the helmet, not its circumference. A ratchet locking system allows one shell of the helmet to be finely adjusted to fit around the head. This results in greatly improved comfort and an enhanced feeling of safety.

RUN SYSTEM ERGO SNOW

Alpina ski helmets rely on the time-tested Run System Ergo Snow, a flexible head adjustment system with a central rotatable control knob. The top-end model has two large pads to the left and right of the redesigned control knob that distribute pressure. The large control knob is made of a two-component mix that grips well and can be perfectly operated even when wearing ski gloves.

RUN SYSTEM CLASSIC

The classic for optimal fit: Thanks to the control knob at the back of the head the helmet can be adjusted to the head in a flash and will reliably remain where it belongs.

3D-FIT

The 3D-Fit System adds five-stage height adjustment to the Run System at the rear of the head. This enables the helmet to be adjusted even more precisely for an individual fit, increasing comfort and enhancing the wearer's feeling of safety along with the snugness of the fit.

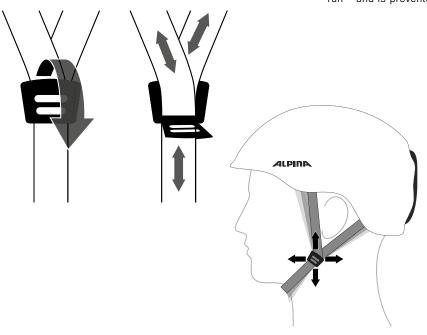

Y-CLIP

A helmet can only protect the wearer as effectively as it stays in its optimal position in case of a fall. The retention of the two under-ear straps plays a crucial part in this. Alpinas "Y-Clip" system guarantees optimal adjustment with millimeter-accuracy – easily and in a matter of seconds.

ERGOMATIC

Proven a hundred-thousand-fold and used in all Alpina ski helmets: Our famous strap buckle with a red push button and multi-step automatic locking mechanism. Ergomatic can be operated when wearing ski gloves – the strap can be loosened while using the ski lift and tightened again before the downhill run – and is prevented from opening on its own in a crash.

SAFETY

HI-EPS

The inner shell of every Alpina helmet consists of HI-EPS (High Expanded Polystyrene). These microscopic air pockets absorb the forces that act in an impact and provide the protective damping. HI-EPS allows extra-thin wall thicknesses and slim helmet shapes to be achieved. As HI-EPS absorbs neither water nor perspiration the protective effect is retained for a long time.

CERAMIC SHELL

This impact- and scratch-resistant polycarbonate shell is fitted to all Alpina helmets manufactured using the Inmold procedure. The blank work pieces are shaped at high temperature onto the form of the helmet design and the shells are then pressed onto the helmet's Hi-EPS body. The material combines a number of distinct advantages: it is impact and scratch-resistant, it contains UV stabilisers and is anti-static.

INMOLD

Inmold ski helmets by Alpina are very light as well as extremely sturdy. This is achieved by a production process in which the helmet's polycarbonate upper shell is fused with the EPS granulate under high heat and pressure. The result is an inseparable bond between the upper and lower shells across a large area.

HARDSHELL

Hard shell helmets have an impact-resistant ABS or polycarbonate outer shell on top of the EPS inner shell. This combination makes the helmets extremely tough and ensures perfect insulation against the cold.

HYBRID-TECHNOLOGIE

Hybrid technology combines the advantages of inmold and hardshell. The lower part of the helmet consists of a light and well-damping inmould shell, whereas the upper part of the helmet is covered by a super robust hardshell. A further advantage is that hybrid helmets can be excellently ventilated due to their construction.

TRM

The "translatory-rotatory-mechanism" (TRM) seals the visor particularly close to the face. The mechanism allows the visor to rotate from the upper to the lower position. In the lower position, a linear movement (translation) ensures that the visor can be moved towards the eyes. This creates a compact fit of the helmet on the head.

JET VISION

Helmets with an integrated visor. A choice of lens from Singleflex and Doubleflex through to Varioflex and Quattroflex. The generous amount of space behind the draught-proof visor makes these helmets perfect for people who wear glasses.

COMFORT

REMOVABLE EARPADS

The Removable Earpads can be detached in fractions of a second and stowed in the pockets of a ski jacket. When enjoying the snow on a warm and sunny Easter weekend, this feature will allow you to experience an even higher degree of freedom during your ride. And when temperatures drop again, just click the earpads back on.

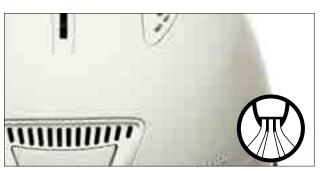

CHANGEABLE INTERIOR

Freecarve or freeride bonanzas can be sweat-inducing affairs! Especially the head acts as a veritable "heat exchanger." That's why Alpina ski helmets equipped with Changeable Interior allow you to quickly remove the interior lining, handwash it in tepid soap water, let it dry and simply insert it again.

NECKWARMER

The Alpina Neckwarmer is pulled down low at the back of the helmet and consists of a comfortable, soft micro-fleece material. This "heat collar" also prevents the neck from being hit by air draft at high speed and Siberian temperatures. Thanks to its clever construction there are no pressure points.

AIRSTREAM CONTROL

Further airstream regulation features the Airstream Control Ventilation openings of the helmet can be opened and closed by a sliding mechanism. Perfect climate around your head is guaranteed.

VENTING SYSTEM

Vents in the shell of the helmet efficiently prevent any build-up of heat and provide perfect air conditioning for the helmet and goggles. The air vents in the helmet draw the warm air from inside the goggles and feed it out through the air channels in the helmet. This effect is optimized when used with the matching goggles, so that the air vents in the goggles dock neatly with those of the helmet. This ensures the circulation of air through the goggles and helmet, preventing misting and the build-up of heat.

GOGGLE TECHNOLOGIES

Weighing only 7 grams and measuring about 25 millimetres, it provides around 90% of our sensory perception. Our eyes come under enormous pressure during alpine sports, especially skiing, snowboarding and ski touring. For every 1000 metres of altitude, UV radiation increases by up to 20%. In addition to this, snow reflects up to

Our most important sensory organ is the eye. 95% of light, compared with only 6% in grassed areas. UV radiation and winds at speeds over 10 km/h can cause permanent damage to the eye. Our eyes are protected by lashes, the secretion of tears, our eyelids and our blinking reflex. However, additional and full protection can only be provided by ski goggles. They offer protection against UVA, UVB and UVC radiation.

ACTIVE VENTING

The active venting in the goggles frame provides air exchange inside the goggles. Thus humidity is transported away and the lens does not fog up. You can operate the ventilation flaps yourself with gloves.

COMFORT FRAME

Small zigzag-shaped, flexible synthethic ties in the forehead and cheek area of the goggle frame plus a more flexible nose construction allow the snow goggles to adapt to the wearer's individual facial shape particularly well - for superior comfort without pressure points!

SPHERICAL LENS

The spherically curved thermal double lens provides clearly improved panoramic vision. In addition, the enlarged interior volume improves thermal management inside the goggles. And Thermoblock plus Fogstop effectively prevent fogging of the goggles.

180°+ VIEW

Alpina snow goggles with 180+ View have a larger field of vision than the 180 degree field required by the CE standard. A special goggle frame and extra-large, curved panoramic lenses make this possible. This ensures a better overview - and earlier recognition of dangers in the peripheral field of vision.

VENTING LENS

Vents in the lens ensure a defined routing of the air flow and ventilation of the goggle lens. This effectively prevents fogging.

HINGE BAND

Our snow goggles featuring Hinge Band technology don't have the goggle strap attached directly to the frame but to movable synthetic hooks on the outside of the frame. This construction provides even better fit of the goggles – especially when they're worn with a ski helmet.

SKID GRIP

Ski helmets typically have very smooth surfaces. When the skier makes dynamic movements on a trail with moguls or in open terrain conventional goggle straps can easily move out of place, unlike goggle straps using Skid Grip technology: The special rubber coating on the inside keeps the goggles from slipping.

MAGNETIC LENS

In fog or under blue skies: Snow goggles featuring Magnetic Lens technology ensure clear vision! You choose between a brighter bad-weather lens and a darker fair-weather lens. The darker lens is attached to the brighter lower lens where it will stay in place by means of a magnet – until you make it disappear in your pocket when the weather turns again.

RIMLESS

In conventional goggles the structure of the goggles holds the front lens in place, but with the rimless variant it is the rear lens that is secured. This means the frame can be reduced to a minimum allowing bigger lenses and a wider field of vision as the double lens is positioned further forward. Rimless goggles are extremely suitable for powder skiing, as the powdery snow will not collect on the rim of the goggles, impeding visibility. Added to this, they are also unbeatable for style.

OVER THE GLASS

Goggles with recesses in the frame and sufficient interior volume that allow regular correction glasses to be worn under the goggles.

SKI HELMET TECHNOLOGIES

AIRSTREAM CONTROL

To control the air stream, the vents in the helmet can be opened and closed using a sliding mechanism.

CHANGEABLE INTERIOR The changeable interior lining can be removed, hand-washed in tepid soap water and simply be inserted again.

CUSTOM FIT SYSTEM A swivel joint allows the neck support to be adjusted to three different angles of incline with the Run System to match the shape of the head.

EDGE PROTECT Edge Protect is an extremely impact- and scratchresistant layer applied to the bottom edge of the helmet using Inmold technology. It enhances safety in the event of a side impact and protects the EPS against damage in everyday use.

ERGO³ ERGO³ allows the helmet to be adjusted so that it fits the head accurately. This involves altering the volume of the helmet, not its circumference. A ratchet locking system enables one of the helmet's shells to be finely adjusted to fit around the head. This results in greatly improved comfort for the wearer and an enhanced feeling of safety.

ERGOMATIC All Alpina helmets are fitted with the Ergomatic strap buckle. The anti-torsion multi-step locking mechanism can be operated with a single hand and cannot come open in a crash.

HARD SHELL A combination of an impact-resistant outer shell (ABS or polycarbonate) plus a shock-absorbing and cold-insulating inner shell (EPS) guarantees a maximum of safety.

HI-EPS The inner shell of all Inmold helmets consists of Hi-EPS (High Expanded Polystyrene). It is made up of a large number of microscopic air pockets which absorb the impact forces that act in a crash. In addition, HI-EPS absorbs neither water nor perspiration.

HYBRID TEC A combination of Inmold and hard shell: the lower part of the helmet is an Inmold shell, and a hard shell encases the EPS in the upper section. The hard shell allows plenty of room for ventilation channels.

INMOLD TEC In the production process for Inmold helmets the inner shell is foam-injected underneath the outer shell under high heat. Thanks to the complete fusion of the upper and lower shells Inmold helmets are extremely stable and very light. In addition, they offer clearly more safety than spot-glued helmets.

JET VISION Helmets with an integrated visor. A choice of lens from Singleflex and Doubleflex through to Varioflex and Quattroflex. The generous amount of space behind the draught-proof visor makes these helmets perfect for people who wear glasses.

NECKWARMER

Neck warmer that is pulled down low on the back of the helmet and made of comfortable, soft micro-fleece.

REMOVABLE EARPADS Removable ear pads provide a feeling of freedom while riding in warm weather – without sacrifice to the protective function. When temperatures drop the pads can simply be attached to the helmet again by means of a clicking mechanism or buttons.

RUN SYSTEM

A simple, rugged adjustment wheel enabling the helmet to be easily adjusted for a perfect fit.

RUN SYSTEM ERGO SNOW A versatile adjustment system with a large, easy-grip two-component wheel and two large pressure-absorbent pads at the rear of the head to give a perfect fit.

VENTING SYSTEM Vents in the shell of the helmet efficiently prevent any build-up of heat and provide perfect air conditioning for the helmet and goggles.

Y-CLIP The Y-Clip connects the front and rear straps beneath the ear. Opening the clip enables the straps to be adjusted easily for a perfect fit.

3D FIT

The head band at the back of the head is height-adjustable in five steps for enhanced fit of the helmet.

Αναι α Ν

The head band at the back of the head is height-adjustable in five steps for enhanced fit of the helmet.

CERAMIC SHELL

The head band at the back of the head is height-adjustable in five steps for enhanced fit of the helmet.

FIDLOCK

The head band at the back of the head is height-adjustable in five steps for enhanced fit of the helmet.

TRM

The head band at the back of the head is height-adjustable in five steps for enhanced fit of the helmet.

SKI GOGGLE TECHNOLOGIES

AIRFRAME VENTING The name of the intelligent ventilation system in Alpina ski goggles. Air vents at the sides and bottom of the goggles with special foam covers allow a continuous movement of air within the body of the goggles. This disperses moisture, preventing the lens from misting up.

180+ VIEW For some models, it was possible to design the goggle frame in combination with a large panoramic lens to provide all-around vision above the 180 degrees required by the CE standard. Due to this enlarged field of vision potential hazards on the slope can be perceived earlier at the sides.

COMFORT FRAME Small zigzag-shaped, flexible synthetic ties in the forehead and cheek area of the goggle frame plus a more flexible nose construction allow the snow goggles to adapt to the wearer's individual facial shape particularly well – for superior comfort without pressure points!

DOUBLE THERMOBLOCK The air chamber between the double lens prevents the inner lens from fogging up.

HINGE BAND The goggle strap is attached to flexible hooks on the outside of the frame. These hooks provide even better fit especially when the goggles are worn with a ski helmet.

MAGNETIC LENS Magnetic Lens snow goggles by Alpina provide clear vision in sunshine and fog: The snow goggles have two lenses with different tinting. The dark fair-weather lens is attached magnetically to the brightening lens where it will firmly stay in place. In bad weather, this extra lens can be quickly detached in a single move.

OVER THE GLASSES Goggles with recesses in the frame and sufficient interior volume that allow regular correction glasses to be worn under the goggles.

RIMLESS In conventional goggles the structure of the goggles holds the front lens in place, but with the rimless variant it is the rear lens that is secured. This means the frame can be reduced to a minimum allowing bigger lenses and a wider field of vision as the double lens is positioned further forward. Rimless goggles are extremely suitable for powder skiing, as the powdery snow will not collect on the rim of the goggles, impeding visibility. Added to this, they are also unbeatable for style.

SPHERICAL LENS The lens that is outwardly curved provides better all-around vision and enlarges the goggles' interior volume, which optimizes ventilation.

VENTING FRAME Vents in the goggle frame ensure circulation of air and ventilation of the goggle lens. This effectively prevents fogging. The air flow is indirect so that no draft can reach the eyes.

VENTING LENS Vents in the lens ensure a defined routing of the air flow and ventilation of the goggle lens. This effectively prevents fogging.

SKID GRIP The rubber coating on the inside of the goggle strap prevents the strap from slipping on the ski helmet.
